

Using Subversion for Source Code Control

Michael McLennan

HUBzero® Platform for Scientific Collaboration

Purdue University

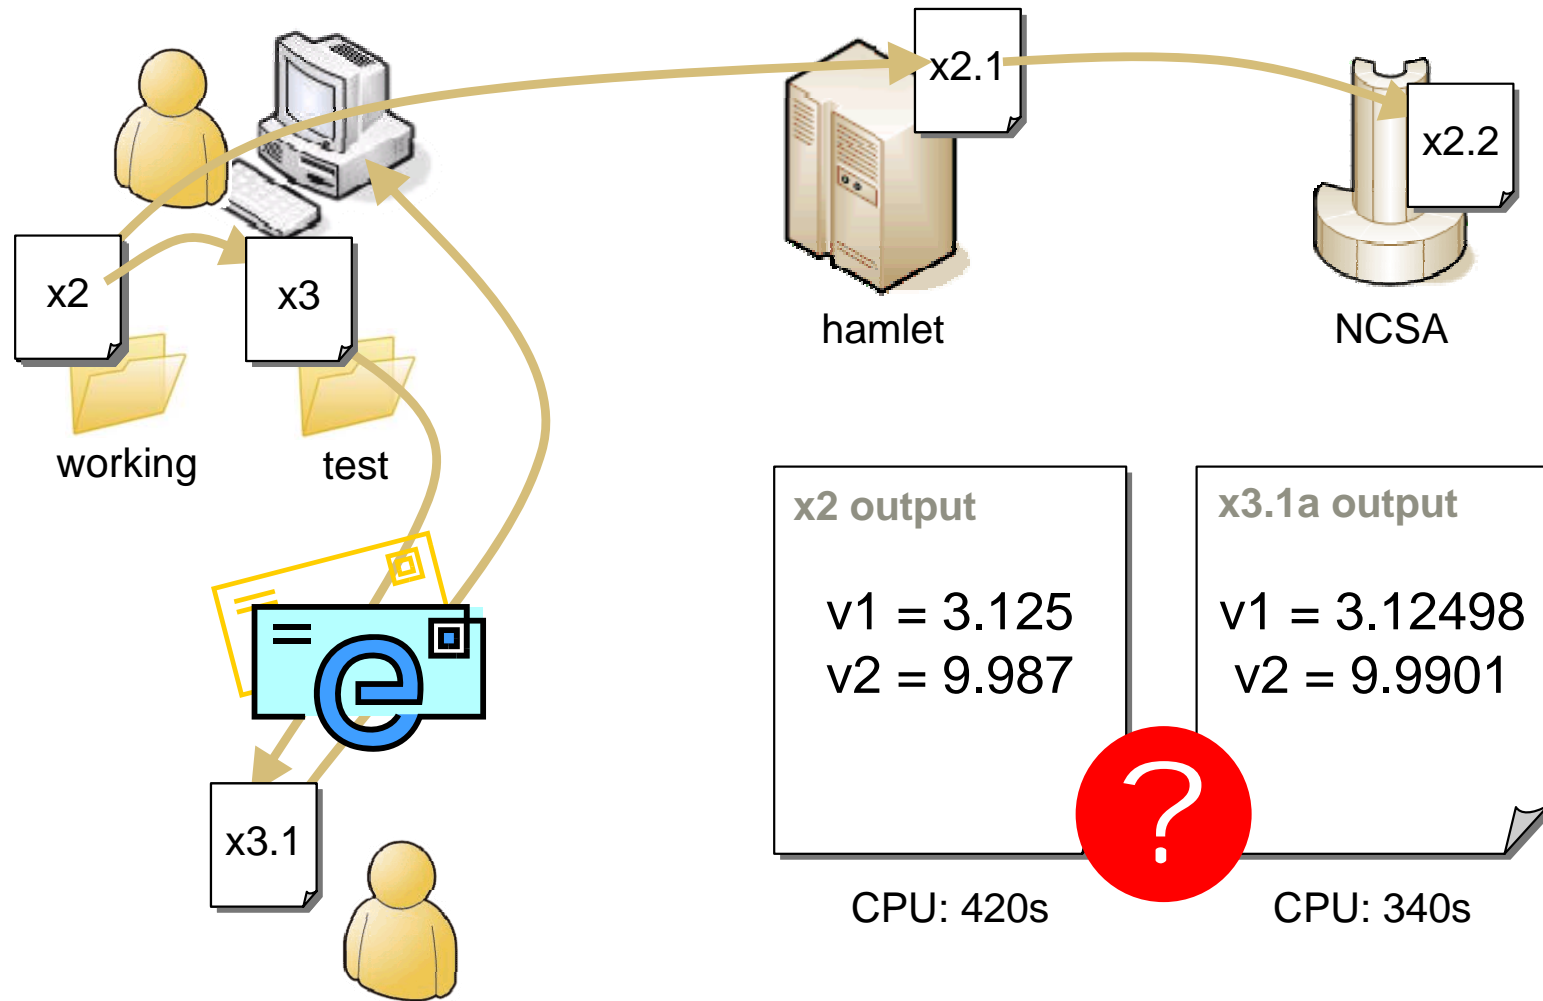

- CVS on steroids
- Created by developers at CollabNet
- In development since 2000
- In production (version 1.0) since Feb 2004
- Open source (Apache/BSD-style license)
- Unix/Linux, Win32, BeOS, OS/2, MacOS X
- Home page: <http://subversion.tigris.org/>

Client/Server model:

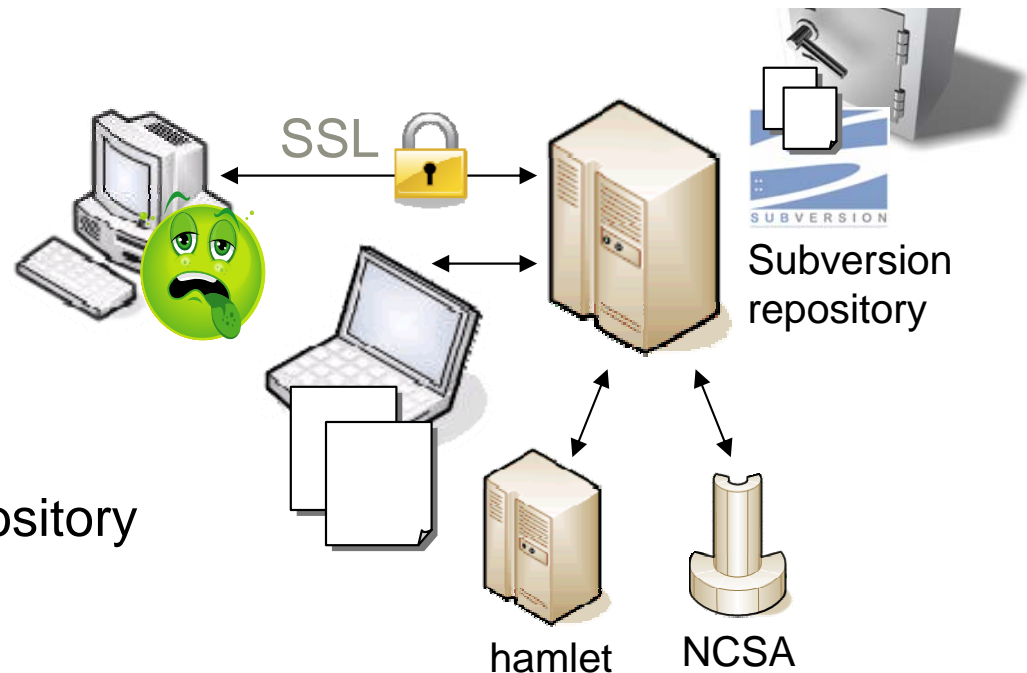

Does this sound familiar?

- **It's better than CVS**
svn commands are nearly identical to cvs (
- **You'll feel more secure**
SSL transport between client/server; repos
- **Where did I put that...**
It's in the repository
- **Who broke the build?**
Look at the revision history
- **Your hard drive just died**
No problem, your code is in the repository

Date	Rev	Chgset	Author	Log Message
03/14/06 09:56:01	8	8	clarksm	Modified to facilitate d
02/20/06 13:03:51	7	7	clarksm	Fixed make install, cle

09/09/05 14:19:59	5	5	clarksnano	Added missing vtk to
09/09/05 12:06:43	4	4	mmc	- Fixed the labeling o
09/07/05 14:05:59	3	3	clarksnano	Moved direct VNC inv
08/31/05 18:45:48	2	2	clarks	Added Rappture GUI .
08/31/05 17:39:13	1	1	clarks	Initial PUNCH version

If you're using Subversion on your own machine...

- Get your files together

```
mkdir initial
```

```
mkdir initial/trunk
```

```
mkdir initial/branches
```

```
mkdir initial/tags
```

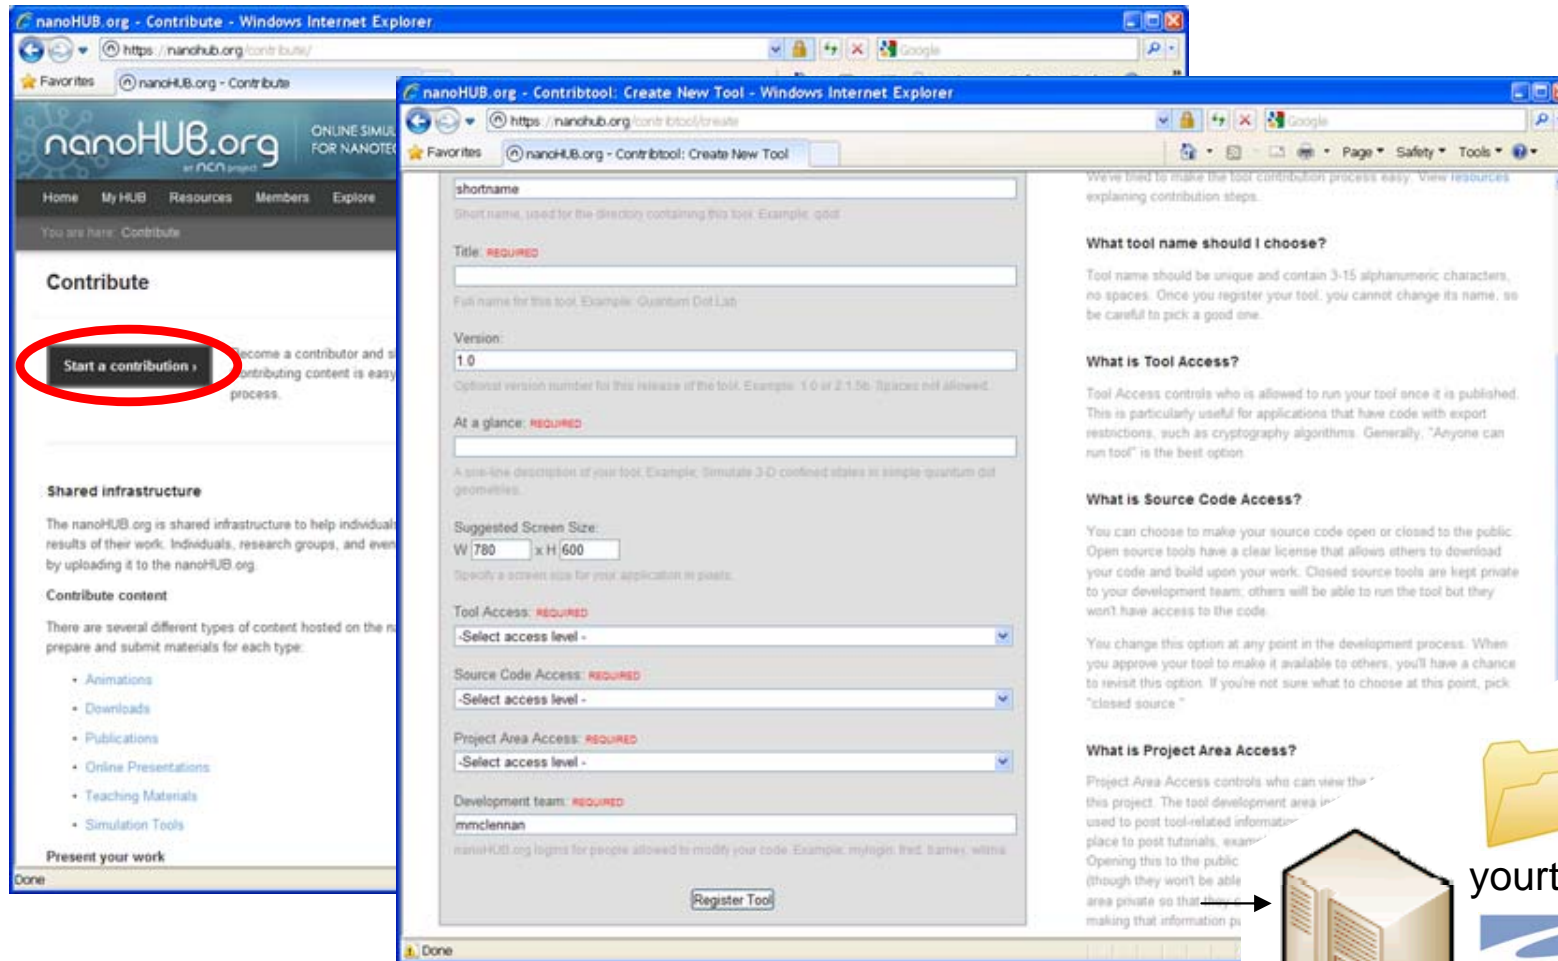

```
mv /home/src/*.c initial/trunk ← put all of your files in the trunk
```

- Create a repository and import your files

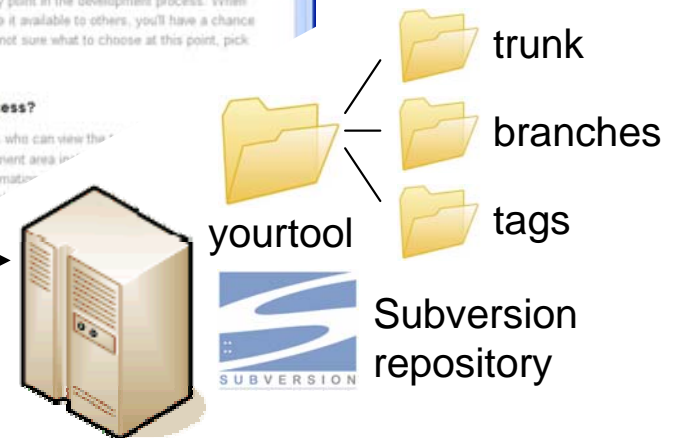

```
svnadmin create --fs-type fsfs /usr/local/svn/repo
```

```
svn import initial file:///usr/local/svn/repo -m "initial content"
```

*Once you register your tool,
your repository is created automatically*

```
svn checkout https://nanohub.org/tools/yourtool/svn/trunk yourtool
```

```
A    yourtool/rappture
```

```
A    yourtool/doc
```

```
A    yourtool/src
```

```
A    yourtool/bin
```

```
A    yourtool/data
```

```
A    yourtool/middlewares
```

```
A    yourtool/examples
```

```
Checked out revision 1.
```

```
mkdir examples/ex1
```

```
vi examples/ex1/README
```

```
svn add examples/ex1
```

```
A    examples/ex1
```

```
A    examples/ex1/README
```

*Instructions in your project area
at [wiki/GettingStarted](#)*

From any machine...

`cd yourtool` ← commit at the top level, so you don't miss anything

`svn status`

```
A    examples/ex1
A    examples/ex1/README
?    a.out
```

brings up your favorite editor:

Created ex1 directory and added the README file.

Date	Rev	Chgset	Author	Log Message
07/25/07 21:31:14	2	2	mmc	Created ex1 directory and added the README file.
07/25/07 21:23:09	1	1	root	initial directory structure

`svn commit`

```
Adding      examples/ex1
Adding      examples/ex1/README
Transmitting file data .
Committed revision 2.
```

Instructions in your project area

More info:

<http://tortoisesvn.tigris.org/>

Puts svn commands onto the right-mouse-button menu:

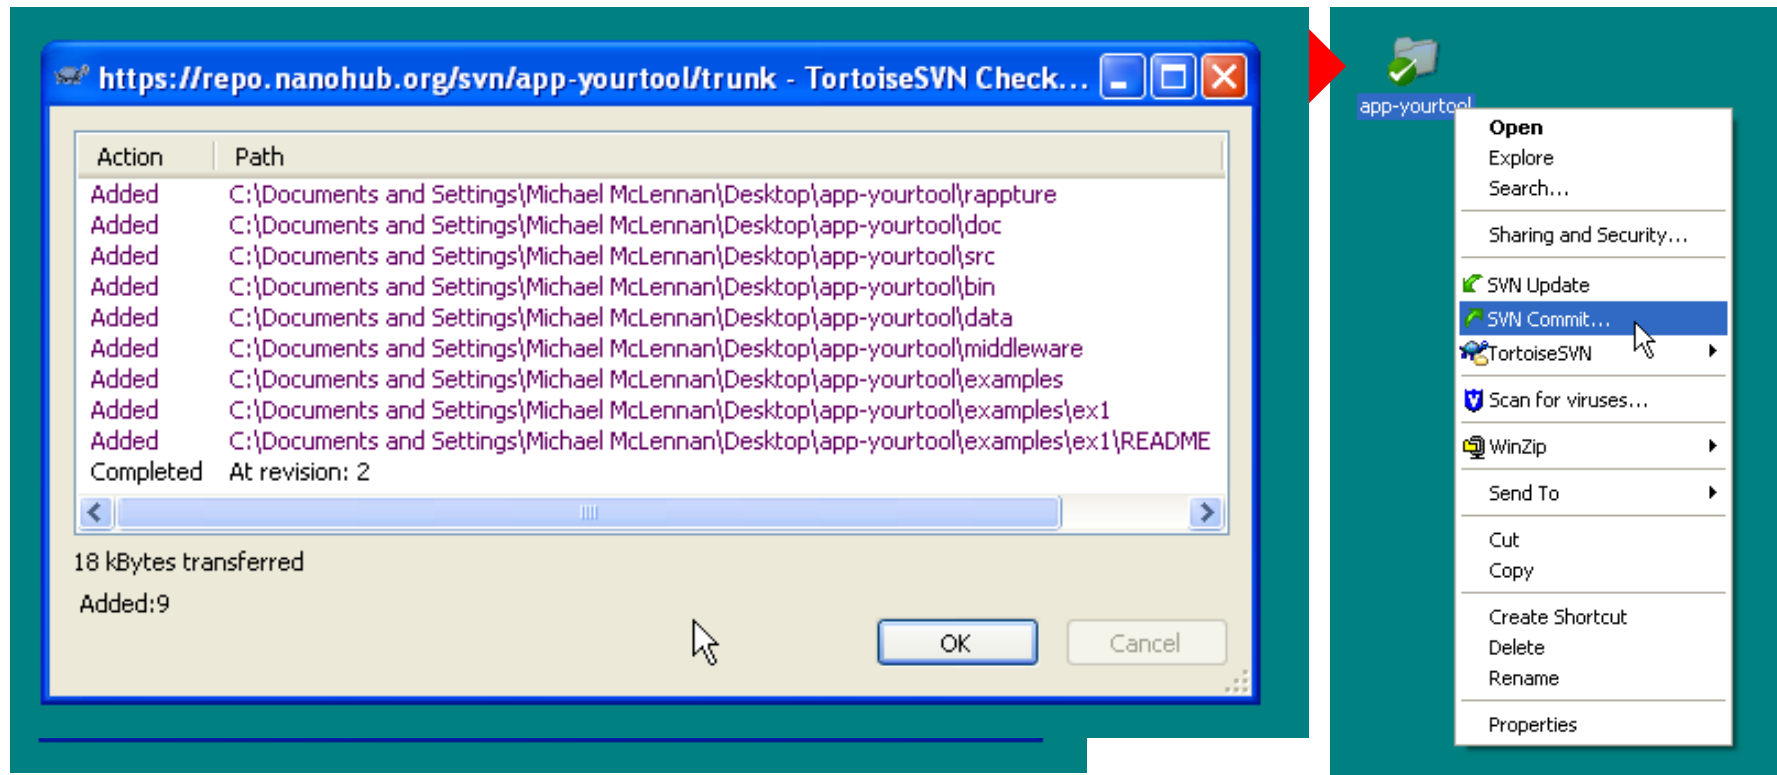

Like any other file on your Desktop, but icon shows Subversion control

More info:
<http://tortoisesvn.tigris.org/>

Puts svn commands onto the right-mouse-button menu:

```
cd examples/ex1
svn mv README README.txt
A  README.txt
D  README
```

brings up your favorite editor:

Moved some files around.

```
cd ../../
svn delete doc
D  doc
```

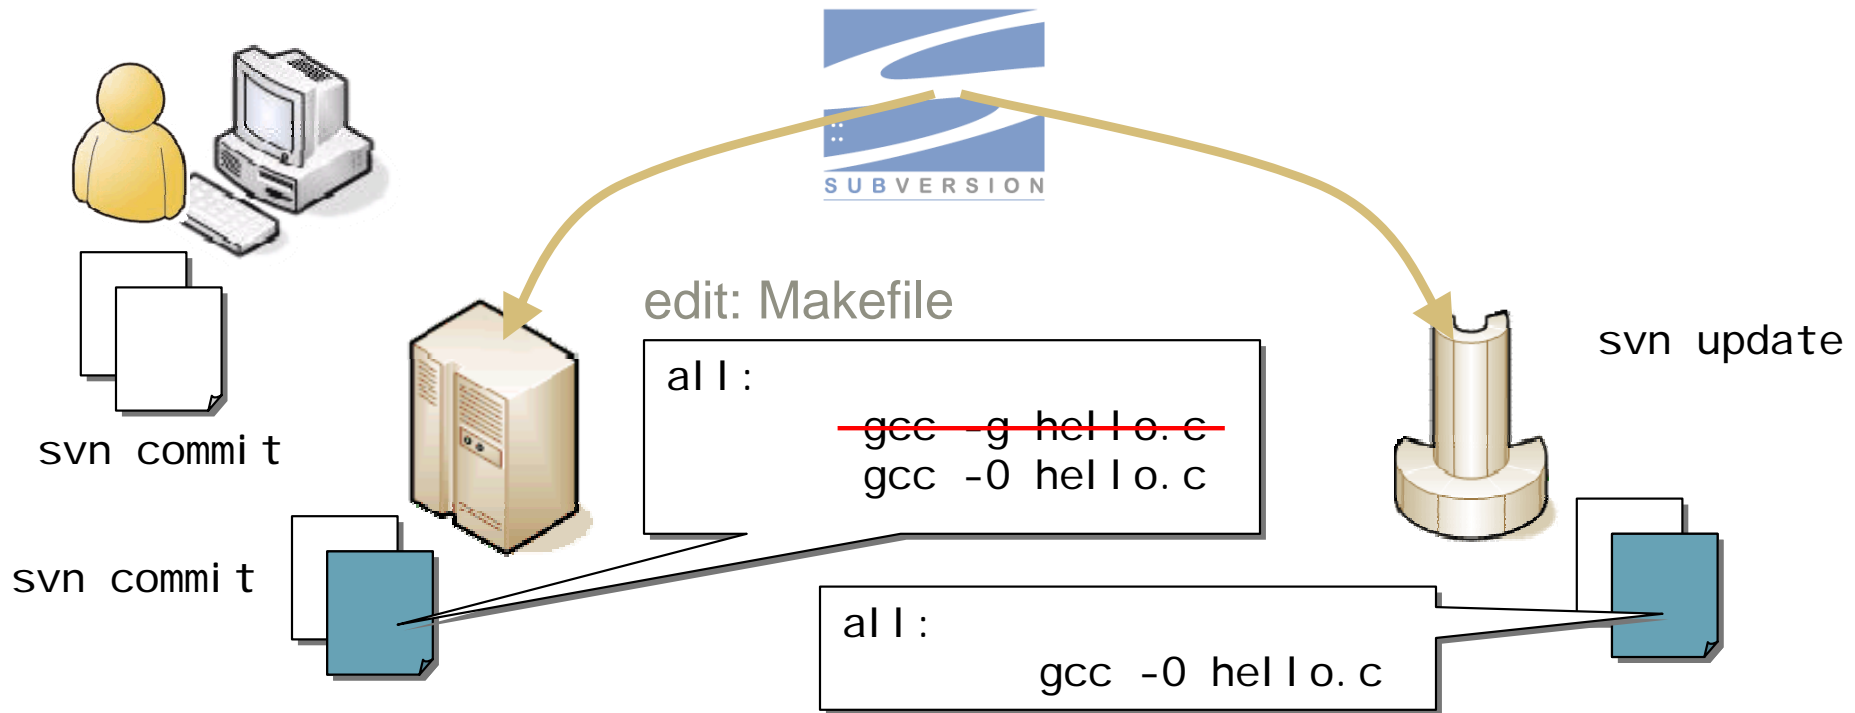

Date	Rev	Chgset	Author	Log Message
07/26/07 09:46:35	3	3	mmc	Moved some files around.
07/25/07 21:31:14	2	2	mmc	Created ex1 directory and added the README file.
07/25/07 21:23:09	1	1	root	initial directory structure

```
svn status
D  doc
A + examples/ex1/README.txt
D  examples/ex1/README
```

```
svn commit
```

What are these secret codes? See [this page](#).

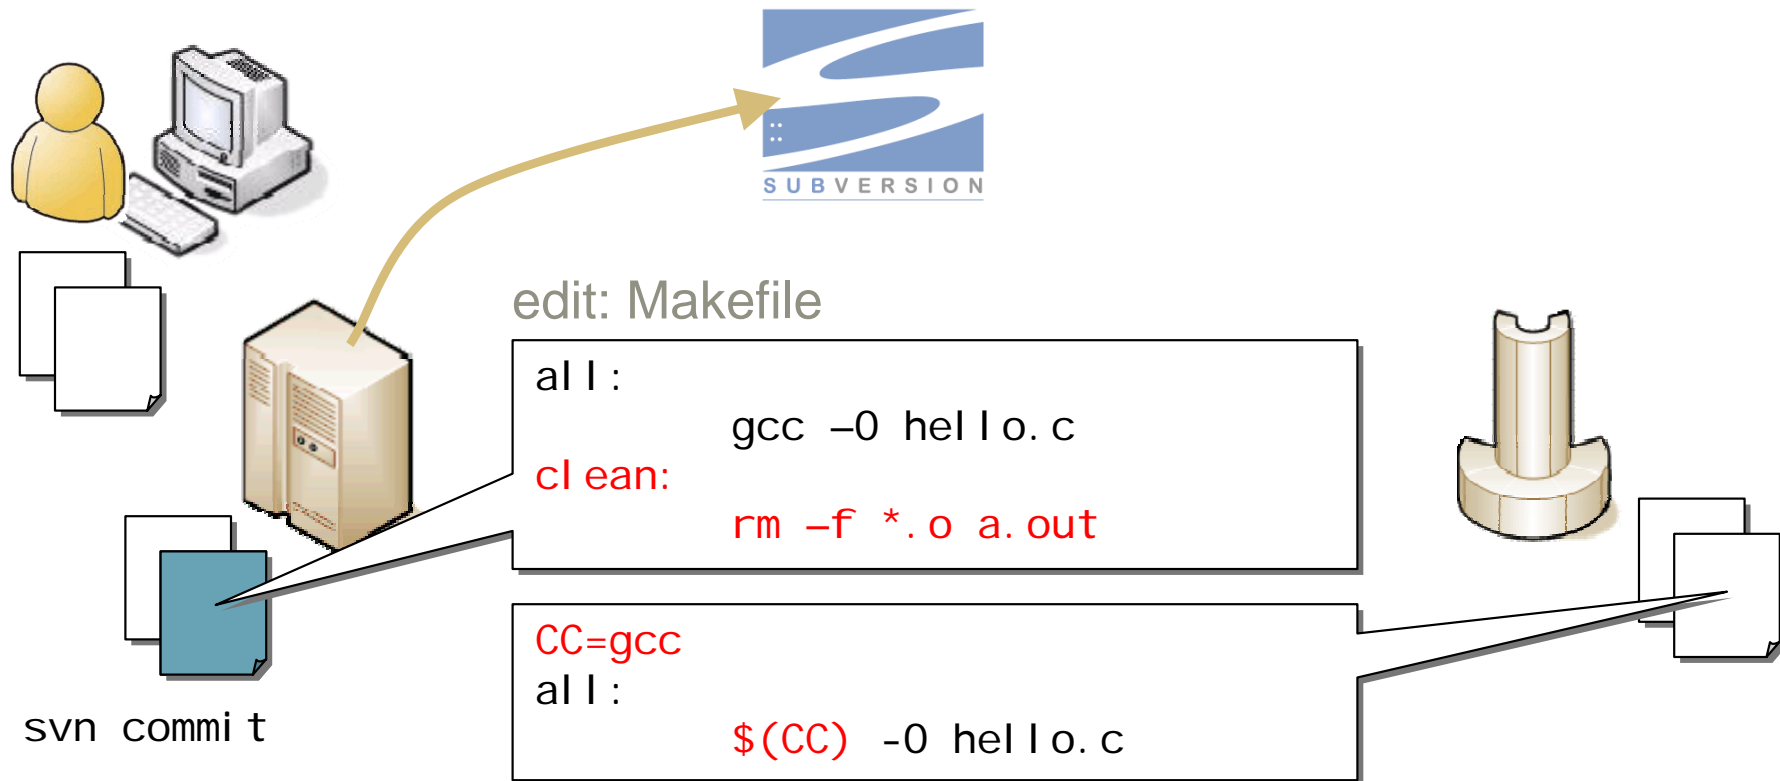

svn checkout <https://nanohub.org/tools/yourtool/svn/trunk/yourtool>

- ~~Copy code around~~
- Move code to new machines with “svn checkout”
- Move changes around with “svn commit” and “svn update”

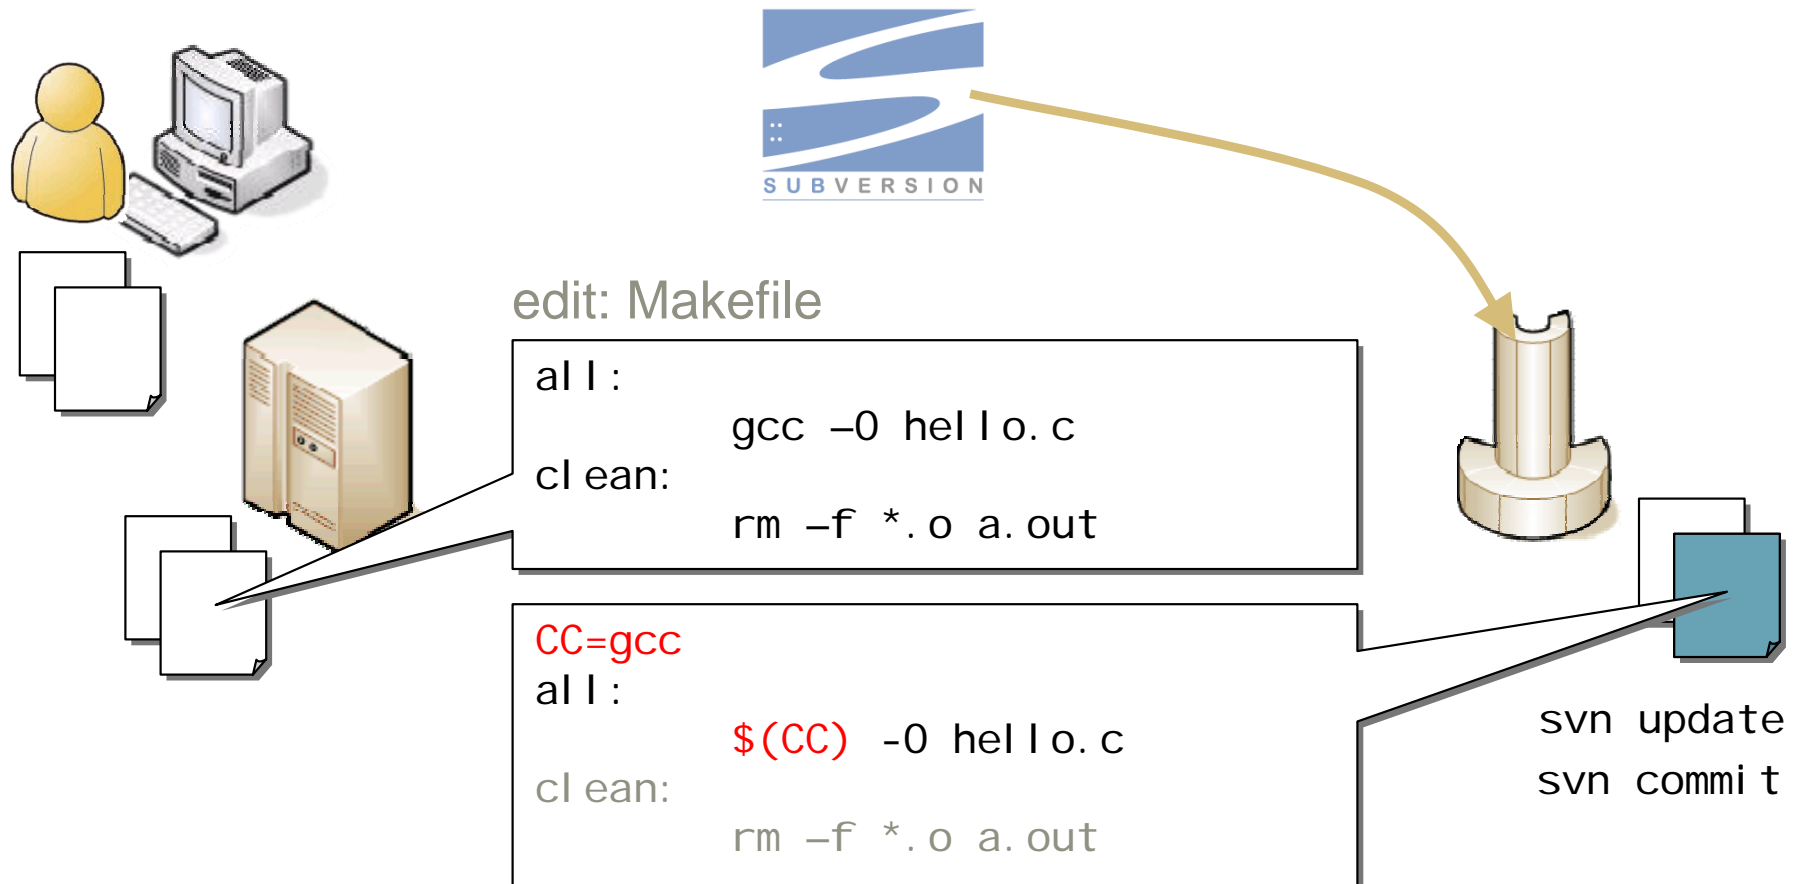

Can also revert
directory changes
(adding/deleting files)

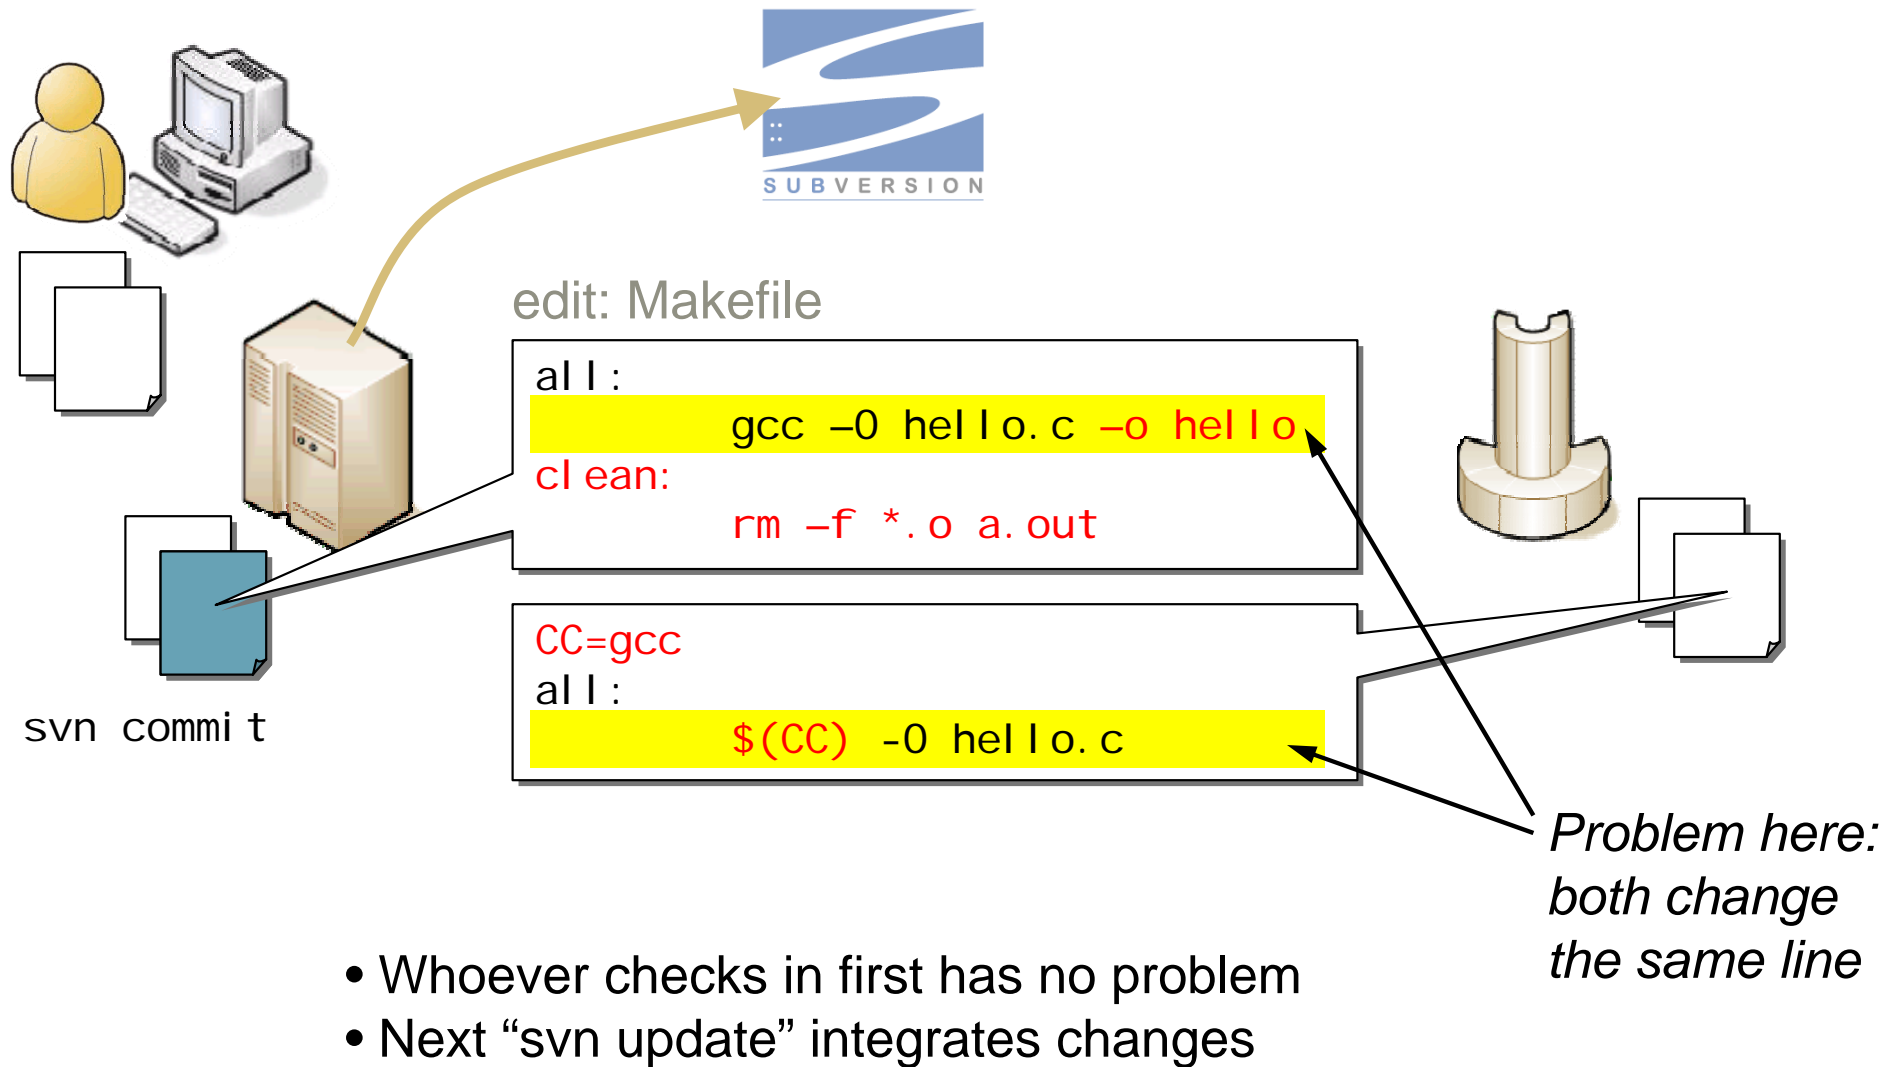

```
svn status
M      src/hello.c
svn diff src/hello.c
Index: src/hello.c
=====
-----
--- src/hello.c      (revision 4)
+++ src/hello.c      (working copy)
@@ -4,6 +4,7 @@
 int
 main(int argc, char **argv)
 {
-   printf("Hello, World! \n");
+   /* say hello to everyone */
+   printf("Hello, Universe! \n");
   exit(0);
 }
svn revert hello.c
Reverted 'hello.c'
```

- Whoever checks in first has no problem
- Next “svn update” integrates compatible changes

- Whoever checks in first has no problem
- Next “svn update” integrates compatible changes
- Use “svn commit” to commit the merged changes

```

svn update
C Makefile
Updated to revision 6.

svn commit
svn: Commit failed (details follow):
svn: Aborting commit: 'Makefile'
remains in conflict

svn status
? Makefile.r5
? Makefile.r6
? Makefile.mine
C Makefile
    
```

conflict!

best guess at integrated changes

vi Makefile

```
CC=gcc
all:
<<<<<<< .mine
    $(CC) -O hello.c
=====
    gcc -O hello.c -o hello
clean:
    rm -f *.o a.out
>>>>>> .r6
```

vi Makefile

```
CC=gcc
all:
<<<<<<< .mine
    $(CC) -O hello.c
=====
    gcc -O hello.c -o hello
clean:
    rm -f *.o a.out
>>>>>> .r6
```

```
vi Makefile
```

```
CC=gcc
all:
    $(CC) -O hello.c -o hello
clean:
    rm -f *.o a.out
```

```
svn resolved Makefile
```

```
Resolved conflicted state of 'Makefile'
```

```
svn commit
```

```
Sending          src/Makefile
```

```
Transmitting file data .
```

```
Committed revision 7.
```

- Get the whole distribution

```
svn checkout -r 3 https://nanohub.org/tools/yourtool/svn/trunk/yourtool
```

get revision 3

- Get a particular file

```
svn cat -r 5 Makefile _____ show me revision 5
```

```
svn cat -r 5 Makefile > Makefile _____ replace current file with revision 5
```

- Which revision?

```
svn log Makefile _____ show me revisions for this file
```

```
svn log _____ show me revisions for current directory
```

Good defaults. Subversion usually does the right thing:

```
cp di agram. j pg exampl es
svn add exampl es/di agram. j pg
A (bin) exampl es/di agram. j pg
svn commi t
Adding (bin) exampl es/di agram. j pg
Transmitting file data .
Committed revision 8.
```

Recognized as a binary file:

- no CR/LF translation
- no merges, only replacements

When it fails, set properties yourself:

```
cp demo. dat exampl es
svn add exampl es/demo. dat
A exampl es/demo. dat
svn propset svn:mi me-type applicati on/octet-stream exampl es/demo. dat
svn propdel svn: eol -styl e exampl es/demo. dat
```

more about properties on [this page](#)

Think of your source code repository as a tree...

Tag important versions:

```
svn copy trunk tags/release1.0
```

*Merging between branches is a pain!
If you need that, use [svk](#).*

trunk

Create a branch:

```
svn checkout https://nanohub.org/.../svn no /trunk yourtool -all
cd yourtool -all
svn copy trunk branches/mclennan
svn commit -m "created private branch for mclennan"
```

```
svn checkout https://nanohub.org/.../svn/branches/mclennan yourtool -mcl
                                     instead of /trunk
```

<https://nanohub.org/tools/bootcamp/wiki>

NCN Software Boot Camp: Training ground for NCN students

Welcome to the NCN Software Boot Camp development area. This project is used whenever we have a workshop for incoming students who are learning to develop software for the nanoHUB environment.

Lab Assignment #11

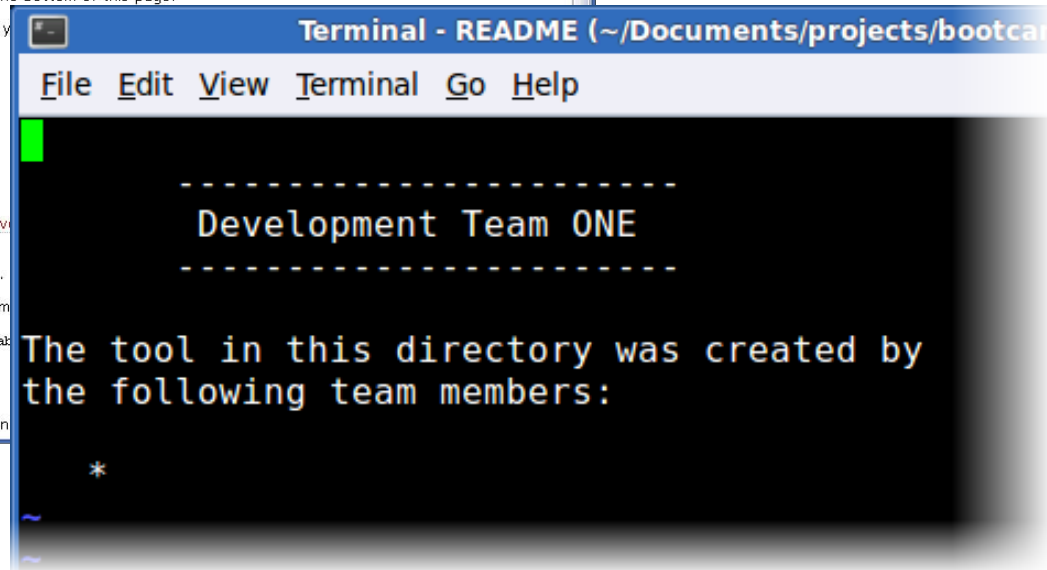

If you're in a workshop right now learning about the nanoHUB development environment, here's your assignment:

- Log in by clicking on the *login* link in the upper-right corner of this page. If you have trouble doing this step, talk to the instructor. Once you've logged in, you should see an *Edit* button at the bottom of this page.
- Click on one of the links below to get to the wiki page for your team:
 - DevTeamOne
 - DevTeamTwo
 - DevTeamThree
 - DevTeamFour
 - DevTeamFive
 - DevTeamSix
 - DevTeamSeven

Lab Assignment #12

- Start up a `workspace` on nanoHUB, and then use `subversion` instructions.
- Look inside the code and find the directory for your group.
- Edit the `README` file within that directory and add your name.
- Edit the `tool.xml` file and add your name in the `<tool><author>` tag assigned to you.
- Check in your code changes.
- Congratulations! You are now an expert in tool development.

- Work in teams
- Use subversion to check out the source code
- Add your name to the README
- Check in your changes

```

Terminal - README (~/.Documents/projects/bootcamp)
